

Here is the background information on your task

The client has responded to your follow-up questions through email. Attached in the next step is the “**Client Response Email**” (consider all attachments mentioned by the client as matching the response. Please refer to the email content for details.) The next step is to complete the deficiency analysis with new support provided and then deliver the final testing results to the client with recommendations for improving the control design and operation if applicable.

Your supervisor Michael has provided some guidance through email (attached in the next step), assisting you in completing the deficiency analysis. Your team also has set up a meeting with the client next week for you to deliver the testing results in person. The team asked you to present the result and to help you prepare the presentation, they’ve given you a list of items to cover:

1. Testing procedure performed
2. Testing period coverage
3. System tested
4. Sample size
5. Testing results
6. Deficiency impact, if any
7. Follow up after remediation

Here is your task

Record a video using the Forage system below simulating testing results delivery with Sam, the client's management. The video should include all the key factors your supervisor provided (below). Please limit your video length to less than 2 minutes.

Hi Sam, thank you for meeting with me today. I’ll walk you through the testing procedures we performed, our coverage period, and the final results, including any identified deficiencies and next steps.

First, **the system tested** was Sage Intacct, and our **testing period** covered **January 1, 2022 through June 21, 2022.**

For this control, we selected **a sample size of 5 new users**, based on PwC’s sampling methodology for a low-risk control with weekly frequency.

Our **testing procedure** focused on verifying three key attributes for each sample:

1. The access request was approved by appropriate management.
2. The access granted was consistent with the request.
3. The role assigned was appropriate for the user's job duties and maintained proper segregation of duties.

After reviewing the items and the follow-up support you provided, we finalized the results.

For **User First Name44 Last Name44**, the initial test result suggested a mismatch between the requested role and the provisioned role. However, your clarification and the attached IT ticket showed the original ticket contained incorrect details, and the correction was documented in the comments. The user's job function remained "Sr. Software Engineer," and the role provisioned aligns with that function. Based on this, we classified the item as a **false positive** and **no deficiency exists**.

For **User First Name77 Last Name77**, our testing identified that the user was provisioned before the approval was in place. Your team confirmed this was a management oversight. Although the user did not log into the system before approval, this still represents a **control deficiency**, since provisioning should not occur until authorization is obtained.

The **impact** of this deficiency is low because there was no unauthorized system activity, and compensating controls appear to be in place, including the quarterly access review and privileged access monitoring.

Next steps:

Because a deficiency was identified, we will increase our sample size during the next phase of testing. We will also assess the operating effectiveness of the compensating controls during that period.

Please let me know if you'd like us to walk through any of the supporting documents together before the next meeting.

Example Answer

Great work! Take a look at the example answer below to see how a professional would have attempted this task. Think about what you did well and how you can improve.

Video Script:

Hi Sam, it's good to see you again.

We have completed the IT SOX testing regarding FY22 Intacct User Access Provisioning control. We appreciate your help along the way, providing timely support, responding to our follow-up questions in a rapid manner and keeping everything organized.

Based on our testing, we have concluded that the control was designed effectively. Among the

population received, we selected five samples for detailed testing. For each sample selected,

we have tested these attributes:

- a. Access request was approved by appropriate management.
- b. Access request is consistent with access granted in the system.
- c. Access request was approved prior to the access provisioning.

There is one false positive sample, as the IT ticketing report was showing outdated information.

Per inquiry, we have updated our workpaper to reflect the actual role being requested. No further action is needed for this sample.

Another sample was called out as deficiency, as agreed by Sam (management) through email.

User “First Name77 Last Name77” was provisioned to Intacct application before access request

was approved. Per inquiry, the root cause of the deficiency is lack of management oversight.

PwC further performed the deficiency impact analysis and noted that there is no risk impact

raised from the deficient sample, as there is no log activity performed by the sampled user during the period between the approval date and the provisioning date.

To further address the deficiency noted regarding the Intacct User Access Provisioning control,

PwC will perform a control remediation testing after the control is deemed remediated by the

management. The testing will select additional samples to ensure the deficiency has been addressed and resolved.

Are there any questions or concerns about our results and recommendation?
